Alphabetical Listing of Location Identifiers for Towered Airports FY 1979

Distribution: A-WX-1; A-X(AS/AT/PL)-2;
A-FAS-1, A-FAT-0(LTD); ZMS-411

ACKNOWLEDGMENTS

This report has been prepared by Thomas Henry and Janice Hartwill who served as forecast team leaders under the direction of Gene Mercer, Chief, Forecasting Branch. Contributions to the study were made by other members of the forecast team: Charles Martin, Michael Pollard, Virginia Price and Barbara Turner.

The computer models were executed by Larry Silvius and Robert Stanley under the direction of Carlton Wine, Chief Information Systems Branch. Mr. Wine and his staff organized and managed the data bases used to produce the forecasts, updated the computer programs and carried out the computer operations necessary to produce the individual airport forecasts. The programming support of Jo Windtberg and K. Sivaram is also gratefully acknowledged.

Special acknowledgments are made to the Regional Planning Officers for their assistance in coordinating the regional reviews, state input, and final forecast recommendations. The extensive reviews and comments of the regional offices were extremely important in guiding the forecast team in making adjustments to the preliminary version of the report. We are confident that the joint effort has produced a more accurate and creditable document than would have resulted had the interaction not taken place.

PART 1:
INTRODUCTION AND NATIONAL SUMMARY

SUMMARY HIGHLIGHTS

- o Forecasts were made for 906 airports--of these 430 are FAA towered airports.
- o Total aircraft operations at FAA towered airports are expected to climb from 69.4 million in 1979 to approximately 100 million by 1992. Most of the growth will occur in general aviation flying.
- o The Western and Southern Regions are forecast to reach 19.3 million and 18.8 million operations, respectively, by 1992--the largest shares among all regions.
- o Currently, 92 percent of all air carrier passengers are enplaned at the top 100 air carrier airports.
- o The top 100 air carrier airports account for 82 percent of air carrier operations.
- o In Fiscal Year 1979, the top 5 air carrier airports--Chicago, Atlanta, Los Angeles, New York (JFK), and San Francisco--enplaned nearly 27 percent of all air carrier passengers and accounted for 18 percent of all air carrier operations.
- o Air carrier enplanements, at 317 million in 1979, are forecast to reach over 580 million by 1992.
- o In FY 1992, 70.3 percent of the air carrier passenger enplanements are expected to occur in the Southern, Western, Eastern, and Great Lakes Regions.

INTRODUCTION

This document presents forecasts of key aviation activity measures for 906 airports including 330 radar approach control facilities through the fiscal year 1992. These forecasts are prepared to meet the planning needs of the Federal Aviation Administration (FAA) offices and services concerned with future traffic levels at these facilities. Except for specific regional requests, the airports selected for inclusion in this publication meet at least one of the following criteria:

- o Existing FAA tower;
- o Candidate for an FAA tower;
- o Currently receiving or forecast to receive certificated route air carrier or scheduled passenger commuter service; or
- o Any general aviation airport that will exceed 60,000 itinerant or 100,000 total operations annually by 1982.

The Terminal Area Forecast (TAF) report is organized in two sections. The first part is a general summary. It includes summary highlights, the introduction, a brief overview of the forecast methodology, and a series of summary tables. This summary provides a national overview as well as a comparison among regions.

Part Two contains the forecast for each airport. It is arranged alphabetically by FAA region and, within each region, by state. The airports in each state are listed alphabetically by city. The airport data include summary information for the facility followed by four years of historical data and annual projections for fiscal years (FY) 1981 through 1992. In some cases, a comment about current or planned aviation activity at the airport is included. The summary indicates the airport's tower/nontower status, number of hours the tower is operated daily, and the number of aircraft based at the airport.

State and regional summary statistics precede the individual airport forecasts. There are five tables that provide regional summaries and state comparisons from fiscal year 1976 through 1992 for air carrier enplaned passengers, air carrier operations, itinerant operations, total operations, and instrument operations.

FORECAST METHODOLOGY

The general approach to the facility forecasts presented in this report is "top-down." National growth factors for each aviation activity were applied to the base year, FY 1979, data at individual airports to project annual activity levels through FY 1992. Thus, the national growth rates obtained from FAA Aviation Forecasts: Fiscal Years 1981-1992, FAA-AVP-80-8 (September 1980) were utilized as control factors and initial rates of growth for individual airports. These preliminary projections were modified using several aviation activity models (discussed below) as well as the facility specific information provided by the 11 FAA regions.

As a general rule, no expansion of airport facilities has been assumed for this forecast except those recommended by the regions and noted in the comments. For some airports, the preliminary forecasts were adjusted to account for known operating constraints. When an airport becomes congested, the growth of aircraft operations at that airport falls below the national average growth rates. In the years after the operating environment has been saturated, the forecasted total operations were assumed to remain constant. Unless additional facilities such as runways or electronic equipment that can safely reduce separation standards are installed, aircraft are expected to use other nearby airports.

Air carrier enplanements at the large air traffic hubs were also adjusted.* To make these adjustments, a model was developed for forecasting enplanements disaggregated into hub originating, connecting, and returning passengers. Moreover, separate equations were developed for hubs characterized as industrial cities, trade centers, or recreation areas, and as connecting cities, terminating points, or intermediate cities. The results of the analysis showed that passengers originating at hubs are primarily dependent on income generated in the hub, while the number of connecting and returning passengers depends on income levels at associated destinations. Growth rates for enplanements at each of the hubs were developed based largely on Department of Commerce forecasts of income generated at these various hubs. These growth rates, which for the most part deviated from the national average, were used to adjust the enplanement forecasts at these hubs. Accordingly, the general top-down approach was augmented for airports within the larger hubs by specific forecasts of aviation activity at these airports.

* Air traffic hubs are not airports; they are the cities and Standard Metropolitan Statistical Areas requiring aviation services and may include more than one airport.

Forecasts of general aviation aircraft operations were based on state parameters such as population, disposable personal income, and state area. Historical trends were modified in response to changes in availability of airport facilities and services, presence of reliever airports, and the attitudes toward general aviation activity at the subject airport. Additional sources of data included supplementary forecasts of general aviation activity at specific airports and regional forecasts of commuter and air taxi operations. Military operations were held constant at the level of operations reported in 1979.

The individual airport instrument operations forecasts reflect assumptions about the increased utilization of avionics by general aviation users and an increase in the number of terminal control areas (TCA) and terminal radar service areas (TRSA).

The FAA regional offices provided updates of based general aviation aircraft and FY 1979 activity at nontowered airports. In addition, other information was received, including the status of plans for new runways and the possibility of new commuter service. These comments were incorporated in this series of forecasts subject only to the constraints imposed by the national forecasts.

Activity Measures Forecast

The activities forecast for each airport include: certificated route air carrier, air commuter, and air taxi enplanements; air carrier, air taxi (including nonscheduled air taxi and scheduled commuter air carriers), and general aviation itinerant and local operations; and instrument operations. A short description of each activity follows.

Air carrier enplanements--includes originating, stopover, and transfer passengers of U.S. certificated route, intrastate, supplemental, and foreign flag air carriers. International passengers who disembark at airports to go through customs and then reenplane are included in an airport's count of passenger enplanements. The historical count of supplemental air carrier enplanements received from the Civil Aeronautics Board (CAB) was based on seats rather than passengers enplaned. Consequently, where supplemental enplanements were added to the other air carrier enplanement count, these data might be overestimated.

Air taxi enplanements--includes survey estimates of nonscheduled air taxi enplanements. Where data is unavailable, enplanement counts are estimated from the number of operations multiplied by a load-factor. The air taxi load-factor typically ranges from 1 to 3.

Commuter enplanements--include enplanements on scheduled commuter air carriers as reported by the CAB.

Local operations--those performed by aircraft that: (1) operate in the local traffic pattern or within sight of the airport; (2) are known to be departing for, or arriving from flights in local practice areas located within a twenty-mile radius of the airport; or (3) execute simulated instrument approaches or low passes at the airport.

Itinerant operations--all aircraft operations other than local operations.

Total aircraft operations--the sum of itinerant and local operations. Every takeoff and every landing is counted as an aircraft operation.

Instrument operations--occur when an FAA operated terminal control facility handles the arrival, departure, or overflight of an aircraft on an IFR flight plan or provides separation to other aircraft. The data published in this TAF include both instrument operations at primary and secondary facilities. Primary facilities are FAA towered airports with radar approach control service. Secondary facilities are airports (towered or nontowered) receiving approach control service from a primary approach control facility. Those instrument operations occurring at secondary airports are credited to both the primary facility and the airport where the physical operation occurs. Non-IFR instrument counts at existing terminal control area facilities and airports with Stage III of expanded area radar service are included under instrument operations. The facility forecasts were adjusted to reflect planned new terminal control areas and terminal radar service areas. Instrument operations are forecast for FAA operated military radar approach control facilities (Air Force RAPCON's and Navy RATCF's).

Stage III/Radar Sequencing and Separation Service for VFR Aircraft--providing traffic information, full-time vectoring and sequencing to arriving VFR aircraft and separation between all participating aircraft.

General aviation operations--all civil aviation operations except air carrier, air taxi, and commuter operations.

Instrument approaches--a series of predetermined maneuvers for the orderly transfer of an aircraft under instrument flight conditions from the beginning of the initial approach to a landing, or to a point from which a landing may be made visually.

This year's published TAF does not include forecasts of annual instrument approaches (AIAs). The historical and forecast data for AIAs are stored in the data base on the computer and are available, if requested, from the regional offices or the Office of Aviation Policy and Plans.

The TAF data base contains almost 4,000 public-use airports including all airports in the National Airport System Plan. Activity levels and forecasts are available for the majority of these airports upon request.

Data Sources

Enplanements are based on data submitted to the CAB by the U.S. certificated route air carriers on Form 41 reports and by the U.S. air commuter carriers on Form 298 reports. These data are supplemented by an FAA survey of air taxi operators, by reports of foreign flag traffic from the Immigration and Naturalization Service, and by state aviation commission and airport manager reports. These sources are used to compile enplanement figures for both towered and nontowered airports.

Historical operations at FAA towered airports are from FAA Air Traffic Activity reports. U.S. air carrier departures at nontowered airports were obtained from CAB Form 41 reports. Other operations at nontowered airports are based on special traffic surveys and on estimates provided in the FAA Airport Master Record FAA Form 5010-1.

Instrument operations handled by FAA towered airports and instrument approaches for all airports are reported in the FAA Air Traffic Activity reports. Region, state, city, airport name, and location identifiers (LOCID) as well as an estimate of based aircraft are taken from the FAA Airport Master Record.

NATIONAL SUMMARY AND COMPARISONS BY REGION

The TAF includes historical and forecast data for 906 airports through fiscal year 1992. Of this total, 430 airports had FAA air traffic control towers in June 1979. Table 1 shows the distribution of these towers throughout the United States. The largest number of FAA towers are located in the Southern Region (83 towers). California leads all states with 51 FAA towers. Texas is second with 27 towers and Florida was third with 26 towers. An alphabetical listing of location identifiers for all towered airports is presented in Appendix A.

Of the 906 airports included in the TAF, 499 airports (55 percent) registered 1,000 or more air carrier enplanements for FY 1979. In total, there were 10.9 million air carrier operations and 317 million air carrier passenger enplanements in FY 1979. The 322 towered air carrier airports had 10.3 million operations and 312 million enplanements. The nontower airports had only 507,441 air carrier operations and only 3.2 million enplaned passengers.

Table 2, Ranking of Air Carrier Airports by Passenger Enplanements, is a list of the top 100 air carrier airports in order of total passengers enplaned during FY 1979. Approximately 92 percent of all air carrier passengers are enplaned at the top 100 airports. The top five airports--Chicago, Atlanta, Los Angeles, New York (JFK) and San Francisco--enplaned 26.8 percent of all air carrier passengers. Approximately 51 percent of all air carrier enplanements in the United States occur at the top 15 busiest air carrier airports.

Table 3 and 4 provide national summaries and regional comparisons from 1976 through 1992 for all carrier enplaned passengers and air carrier aircraft operations for all airports published in the TAF. Tables 5 through 7 show itinerant aircraft operations, total aircraft operations, and instrument operations at airports with FAA-operated air traffic control towers and radar approach control facilities. The percent distributions of these various activities among the regions are shown in Tables 8 through 11.

The forecasts in this volume do not assume construction of additional runways, runway extensions, or other enhancement of the existing facility at specific airports except where mentioned as a footnote to the individual forecast.

Tables 12, 13, and 14 indicate total, itinerant, and local general aviation aircraft operations for the almost 4,000 airports included in the TAF data base. It is estimated that the TAF data base represents approximately 80 percent of the total general aviation operations.

A summary of growth factors for general aviation itinerant and local operations by region and state for nontowered airports is provided in Table 15. These growth rates may be used as a guide for making or reviewing aviation activity projections at airports not included in the published TAF. The number of based aircraft at an airport is sometimes used as an index of aviation activity or potential aviation activity at specific airports or regions. Table 16 presents a summary of based aircraft by states and FAA regions as of June 1980. The total of 168,898 aircraft based at airports included in the TAF data base represents approximately 81 percent of the active general aviation fleet.
